Return to Robots

Using the MongoDB Node library, create the LinkedIn for Robots project.

In week 1 of Back-End Fundamentals, you built a directory site with job and skill information for robots.

Today, you should download the same data you used in that project. The download link is included here.

[Forked JavaScript file.](#)

Load this data into MongoDB and rebuild the directory site. You will have to query the database via the MongoDB library (`mongodb`) to get this data.

This time, add links at the top of the page to go to a page of robots that are currently looking for work and a page of robots that are currently employed.

Hard mode

If you are up to it, make countries and skills into links that will take you to a page that only shows robots from that country or have that skill.
